21)

a) False - \vec{x} must be non-zero.

b) True - An eigenvalue is zero iff A is non-invertible.

c) True - This comes from the equation $A\vec{x} = \lambda\vec{x}$

d) True - It is found by checking $A\vec{x} = c\vec{x}$

e) False - Row reducing changes the eigen values, and eigenvectors.

22)

a) False - \vec{x} must be non zero.

b) False - Linearly independent values can have the same eigenvalue. This is different from theorem 5-2

c) True - In a difference equation $\vec{x}_p = A\vec{x}_p$, where \vec{x}_p is the steady state vector.

d) False - The eigenvalues are only on the diagonal of triangular matrices

e) True - It is the nullspace of $A - \lambda I$ where λ is an eigenvalue of A .

17) Find the eigenvalues of the matrix $\begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & 5 \\ 0 & 0 & -1 \end{bmatrix}$.

By theorem 5-1, they are $\{0, 2, -1\}$

19) For $A = \begin{bmatrix} 1 & 2 & 3 \\ 1 & 2 & 3 \\ 1 & 2 & 3 \end{bmatrix}$, find one eigenvalue.

The columns of A are linearly dependent (scalar multiples). Hence one eigenvalue is 0 .

Section 5-1 - Eigenvalues and Eigenvectors

23) Explain why a 2×2 matrix can have at most two distinct eigenvalues. Why can an $n \times n$ matrix have at most n distinct eigenvalues.

An eigenvalue corresponds to a set of vectors linearly independent to other eigenvectors.

Hence, a 2×2 matrix can have at most 2 linearly independent sets of vectors. Any more and they would not be linearly independent. The same goes for an $n \times n$ matrix which can have at most n linearly independent sets.

15) Let λ be an eigenvalue of an invertible matrix A . Show that λ^{-1} is an eigenvalue of A^{-1} .

$$A\vec{x} = \lambda\vec{x}$$

$$A^{-1}(A\vec{x}) = A^{-1}(\lambda\vec{x})$$

$$(A^{-1}A)\vec{x} = \lambda(A^{-1}\vec{x})$$

$$I_n \vec{x} = \lambda(A^{-1}\vec{x})$$

$$\frac{1}{\lambda}\vec{x} = A^{-1}\vec{x}$$

$$\lambda^{-1}\vec{x} = A^{-1}\vec{x}$$
